GROUND ANCHOR SYSTEM

All the new headstones that we sell are fixed in the cemetery with a single anchor fixing system.

The bar is driven into the ground through a pre-set hole in the foundation. The washer is simply adjusted and set to the required thickness of the memorial base plate (in effect a third dowel hole).

The memorial foundation requires a through hole 28mm diameter centrally positioned corresponding to the base when correctly aligned front to rear.

The diagram illustrates the anchor system.
